YOUR GENERATED ASSESSMENT PROFILE

Hyperpigmentation & Sun Damage

Dark spots and uneven tone are dominant. Consistent treatment needed.

Your report at a glance

MAIN CONCERNS Melasma / Dark spots, Sun damage, Post-inflammatory marks	KEY NEXT STEP SPF 50+ daily — Broad spectrum

This report summarises the answers you provided in an online self-assessment. It is intended to support informed next steps and does not establish a diagnosis or replace consultation with a qualified clinician.

01 | Your Assessment Summary

This section presents the profile and indicators generated by the assessment engine for this completed test.

Main concerns identified

- Melasma / Dark spots
- Sun damage
- Post-inflammatory marks

Assessment indicators

Values below are populated directly from the saved assessment output.

INDICATOR	VALUE	INTERPRETATION
Acne	35%	Acne activity is mild, not the primary driver of current concerns.
Pigmentation	88%	Pigmentation is high, indicating dominant dark spots or uneven tone.
Sun Damage	82%	Sun damage indicators are high, consistent with prolonged unprotected exposure.
Barrier	55%	Skin barrier shows moderate weakening, which can make pigmentation harder to treat.

Important: unless clinically validated, percentages are assessment indicators generated by the questionnaire — not probabilities, diagnostic certainty or validated clinical severity scores.

Factors reported in your answers

Moderate to severe dark spots or melasma, high daily sun exposure without protection, and an inconsistent SPF routine were reported.

What this may mean

Your results show dark spots and uneven tone as the dominant concern, closely linked to sun exposure. Consistent, daily SPF use combined with targeted brightening actives is essential — results typically take 8-12 weeks to become visible.

Please seek timely medical evaluation for sudden or rapidly worsening symptoms, painful/inflamed scalp or skin, significant patchy hair loss, severe reactions or any other urgent concern.

02 | Your Personalised Care Roadmap

The recommendations below are tailored to your saved assessment output and reviewed against Dr Dermat's approved clinical content.

Recommended next steps

SPF 50+ daily
Broad spectrum

Alpha Arbutin / Tranexamic
Target melanin

Azelaic Acid
Multi-benefit

Everyday care guidance

Pigmentation & Sun Protection Routine

Apply SPF 50+ broad-spectrum sunscreen every day, reapplying if outdoors for extended periods. Layer in alpha arbutin or tranexamic acid to target melanin, and azelaic acid for additional brightening and anti-inflammatory benefit.

Professional review

A dermatologist review is recommended to confirm whether melasma or another pigmentation disorder is present, and to discuss in-clinic options (peels, lasers) if topical treatment alone is insufficient.

Follow-up plan

Re-assess pigmentation and tone evenness in 8-12 weeks, as improvement is typically gradual.

Any medicines, supplements, procedures or medical treatment must be assessed for suitability by an appropriately qualified clinician. Do not start or stop prescription medication solely on the basis of this automated report.

03 | Your Next Step with Dr Dermat

Explore relevant services and products selected from the current Dr Dermat catalogue, mapped to your assessment.
